PARISHRAM 2.0 2026 (Class 12th)
Biology (Zoology)
Human Reproduction

DPP 8

Q1 What process occurs towards the end of pregnancy and causes the mammary glands to start producing milk?
(A) Ovulation (B) Menstruation
(C) Lactation (D) Fertilization

Q2 The milk produced during the initial few days of lactation is called _____, which is essential for developing resistance in newborn babies.
(A) normal milk
(B) colostrum
(C) formula
(D) All of the above

Q3 The period of human pregnancy, which lasts about 9 months is known as the _____.
(A) fertility period
(B) gestation period
(C) menstrual cycle
(D) ovulation period

Q4 The process of vigorous uterine contractions at the end of pregnancy that leads to the expulsion of the foetus is called _____.
(A) ovulation (B) parturition
(C) lactation (D) fertilization

Q5 Which of the following is the correct sequence of events leading to parturition?
(A) Oxytocin secretion Uterine contractions Foetal ejection reflex Expulsion of the placenta
(B) Foetal ejection reflex Oxytocin release Uterine contractions Expulsion of the baby Expulsion of the placenta
(C) Uterine contractions Foetal ejection reflex Oxytocin secretion Expulsion of the baby
(D) Expulsion of the placenta Uterine contractions Foetal ejection reflex Oxytocin release

Q6 The signals for parturition originate from which of the following?
(A) Maternal brain and pituitary gland
(B) Ovaries and fallopian tubes
(C) Uterine muscles and cervix
(D) Fully developed foetus and placenta

Q7 The foetal ejection reflex triggers the release of _____ hormone from the maternal pituitary.
(A) estrogen
(B) progesterone
(C) oxytocin
(D) Human chorionic gonadotropin (hCG)

Q8 What type of mechanism induces parturition?
(A) Immune mechanism
(B) Neuroendocrine mechanism
(C) Respiratory mechanism
(D) Digestive mechanism

Q9 The stimulatory reflex between uterine contractions and oxytocin secretion results in _____.
(A) excessive bleeding only
(B) secretion of prolactin only
(C) dedifferentiation of mammary glands
(D) expulsion of baby and placenta

Q10 After birth, colostrum is released from mammary glands which contains several _____.
(A) fat globules
(B) proteins and fat
(C) antibodies

(D) All of the above

Answer Key

Q1	C
Q2	B
Q3	B
Q4	B
Q5	B
Q6	D
Q7	C
Q8	B
Q9	D
Q10	C

Hints & Solutions

Note: scan the QR code to watch video solution

Q1 Text Solution:

During pregnancy, the mammary glands undergo differentiation, and milk production begins towards the end through the process known as lactation.

Video Solution:

Q2 Text Solution:

The milk produced during the initial few days of lactation is called colostrum which contains several antibodies absolutely essential to develop resistance for the new-born babies.

Video Solution:

Q3 Text Solution:

The average duration of human pregnancy is about 9 months, and this period is referred to as the gestation period.

Video Solution:

Q4 Text Solution:

The process of childbirth, where vigorous contractions of the uterus lead to the expulsion of the foetus, is known as parturition.

Video Solution:

Q5 Text Solution:

The sequence starts with the foetal ejection reflex, which triggers the release of oxytocin from the maternal pituitary. Oxytocin causes stronger uterine contractions, which then leads to the expulsion of the baby. After the baby is delivered, the placenta is expelled from the uterus.

Video Solution:

Q6 Text Solution:

The signals for parturition originate from the fully developed foetus and placenta, which induce mild uterine contractions known as the foetal ejection reflex.

Video Solution:

Q7 Text Solution:

The foetal ejection reflex triggers the release of oxytocin from the maternal pituitary, which

plays a crucial role in stimulating uterine contractions during labor.

Video Solution:

Q8 **Text Solution:**

Parturition is induced by a complex neuroendocrine mechanism involving signals from the fetus, placenta, and the release of hormones like oxytocin.

Video Solution:

Q9 **Text Solution:**

The stimulatory reflex between uterine contractions and oxytocin secretion results in expulsion of baby and placenta.

Video Solution:

Q10 **Text Solution:**

The milk produced during the initial few days of lactation is called colostrum which contains several antibodies absolutely essential to develop resistance for the new-born babies.
